The peptides were identified by modifying the p53 consensus binding sequence by substitution of an Alanine at each pos. and identifying which amino acid changes altered binding to expressed MDM2. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.

The invention relates a method of identification of a compound that

modulates coactivator binding to a nuclear receptor. The method

comprises modelling test compounds that fit spatially into a nuclear

receptor (NR) coactivator binding site of interest using an atomic

structural model of a nuclear receptor coactivator binding site. The

coactivator binding site, leading to the interest using an atomic

coactivator binding site, leading to the indentification of a compound

which modulates coactivator binding. Nuclear receptors are a superfamily

coactivator binding site, retinoid receptors (RARs and RARs), peroxisome

commone receptors (TRR), retinoid receptors (RARs and includes thyroid

copperors (PRARs), quecocrticoid receptors (RRS), peroxisome

receptors (PRARs), quecocrticoid receptors (RRS), progestin receptors

copperors (RRS), These receptors (RRS), androgen receptors

construction, for example NRS can stimulate transcription in

compare ligand, also bind coactivators proteins that are involved in

compare ligand, also bind coactivators of the plob (Emily mediate

compare to hormone binding by recruiting coactivator proteins to the

compare receptor's ligand binding domain, AP2, that is part of the

conclusive of a transcriptional activation domain, AP2, that is part of the methods are appoint or antelear receptor's ligand binding domain. The method may be used to

compare the methods can also be used to identify residues which

men methods are an also be used to identify residues which

men methods are an also be a nuclear receptor of interest.

This can facilitate generation of either rissue specific or function-specific compounds. Nuclear receptors have been implicated in a variety of medical disorders, including breast cancer, prostate cancer cardiac arrhythmia, infertility, osteoporosis, hyperthyroidism, hypertholesterolomema and obesity. Sequences AAV58282-AAV58302 represent the regions (NR-boxes 1-3) of p160 coactivator proteins which interact with the nuclear receptor coactivator binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying modulators of nuclear receptor coactivator binding useful for generating new compounds which distinguish nuclear receptor isoforms -

sites (AAYS8307-Y58328). The NR coactivator binding sites comprise two regions of the NR; helices 3-6 (H3-H6), and helix 12 (H12). The coactivator NR-boxes all share a consensus sequence LXXLL (AAYS8278), with the NR-box 2 motifs sharing the consensus motif ILXXLL (AAYS8279). Sequences AAYS8280-Y58281 represent the hydrophobic interaction motifs of p53 and VP16 used in an exemplification of the invention. Sequences AAYS8329-Y58240 represent mutant versions of the human Grip-1 NR-box 2 sequence (AAYS8283), and sequences AAYS8341-Y58353 represent mutant versions of NR coactivator binding sites, used in exemplifications of the

The invention relates to a method for identifying a compound that

```
modulates coactivator binding to a nuclear receptor (NR). The method comprises modelling test compounds that fit electrostatically into an NR caactivator binding site (BS) using an appropriate atomic structural model of (BS); screening the test compounds in an assay characterised by binding of a test compound to (BS); and identifying a library or test compound that modulates coactivator binding to the NR. The methods of the compound that modulates coactivator binding to the NR. The methods of the invention are useful for identifying peptides, peptidomimetics, or small cativity, particularly new lead compounds, scaffolds and combinatorial libraries. The methods are used in selecting and characterising structure (function relationships of natural or synthetic coactivator compounds, which are useful in treating nuclear receptor-based disorders e.g. breast cancer, prostate cancer, cardiac arrhythmia, infertility, osteoporosis, hyperthyroidism, hypercholesterolaemia or obesity. This sequence corpusation (RR) nuclear receptor of the invention is able to interact context in motific with peptides containing this motif.
                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antagonists of endothelin are claimed which are C-terminal hexapeptides and analogs of BT-1. The first (N-terminal) amino acid of the new peptides has D-configuration. The peptides are claimed generically. The present peptide is a specifically claimed example of the generic compounds.

The peptides are useful for treating hypertension, metabolic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hexa:peptide derivs. inhibiting endothelin - for treatment of e.g. renal failure, hypertension, asthma, restenosis, angina, cancer etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

The peptide is prepd. by cyclisation of the synthetic peptide. The Trp residue at posn. 3 may be side chain protected with a lower alkanoyl gp; the Glu residue at posn. 4 may be protected with an al (lower) alkyl gp. An analogous natural peptide, WS 7338, may be isolated from cultures of Streptomyces sp. no. 7338.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 peptide prepd. by culturing Streptomyces spp - used as

They strongly inhibit the vasoconstrictive action of endothelin. They are useful as drugs for improving circulatory function in mammals, in treatment of myocardial infarction, acute renal dysfunction or asthma. Thesse peptides may be prepared by conventional methods of solid or aqueous phase synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cyclic, endothelin; inhibitor; vasoconstriction; drug; circulation; mammal; myocardial infarction; renal dysfunction; asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New cyclic penta:peptide derivs. contg. one L-aminoacid - inhibit endothelin receptor activity, vasoconstriction etc., useful for treating myocardial infarction, acute renal dysfunction and

They strongly inhibit the vasoconstrictive action of endothelin. They are useful as drugs for improving circulatory function in mammals, in treatment of myocardial infarction, acute renal dysfunction or asthma. Thesse peptides may be prepared by conventional methods of solid or aqueous phase

They strongly inhibit the vasoconstrictive action of endothelin. They are useful as drugs for improving circulatory function in mammals, in treatment of myocardial infarction, acute renal dysfunction or asthma. Thesse peptides may be prepared by conventional methods of solid or aqueous phase synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cyclic; endothelin; inhibitor; vasoconstriction; drug; circulation; mammal; myocardial infarction; renal dysfunction; asthma.

                                                                                                                                                                                                             The sequences given in AAR35418-28 are cyclic peptides which act as endothelin inhibitors. They strongly inhibit the vasoconstrictive action of endothelin. They are useful as drugs for improving circulatory function in mammals, in treatment of myocardial infarction, acute renal dysfunction or asthma. Thesse peptides may be prepared by conventional methods of solid or aqueous phase

                                                                                                                                                                                                                                                                    The sequences given in AAR35418-28 are cyclic peptides which act as endothelin inhibitors. They strongly inhibit the vasoconstrictive action of endothelin. They are useful as drugs for improving circulatory function in mammals, in treatment of myocardial infarction, acute renal dysfunction or asthma. Thesse peptides may be prepared by conventional methods of solid or aqueous phase synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cyclic; endothelin; inhibitor; vasoconstriction; drug; circulation; mammal; myocardial infarction; renal dysfunction; asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New cyclic penta:peptide derivs. contg. one L-aminoacid - inhibit endothelin receptor activity, vasoconstriction etc., useful for treating myocardial infarction, acute renal dysfunction and

They strongly inhibit the vasoconstrictive action of endothelin. They are useful as drugs for improving circulatory function in mammals, in treatment of myocardial infarction, acute renal dysfunction or asthma. Thesse peptides may be prepared by conventional methods of solid or aqueous phase synthesis.
endothelin inhibitors. They strongly inhibit the vasoconstrictive action of endothelin. They strongly inhibit the vasoconstrictive action of endothelin. They are useful as drugs for improving circulatory function in mammals, in treatment of myocardial infarction, acute renal dysfunction or asthma. Thesse peptides may be prepared by conventional methods of solid or aqueous phase
                                                                                                                                                                                       Cyclic, endothelin; inhibitor; vasoconstriction; drug; circulation; mammal; myocardial infarction; renal dysfunction; asthma.

                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAR35418-28 are cyclic peptides which act as endothelin inhibitors. They strongly inhibit the vasoconstrictive action of endothelin. They are useful as drugs for improving circulatory function in mammals, in treatment of myocardial infarction, acute renal dysfunction or asthma. Thesse peptides may be prepared by conventional methods of solid or aqueous phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Endothelin; metal conjugate; complex; diagnostic; contrast agent;

This invention describes novel complexes of compounds which have the formula B-L-(K)b with metal ions of atomic number 21-32, 37-39, 42-51 and 57-38 where E = residue of an endothelin (or its derivative, partial sequence, analogue or antagonist), including forms with free SH groups that bind directly to metal, optionally labelled with radioactive iodine isotopes, L = bond, Z1-R-Z2 or a group (i), R = 1-20. Optionally constituted by 10 and/or epoxy, and coptionally interrupted by 1 or more 0, S, CO, NCO or NH (the last 2 optionally interrupted by 1 or more 0, S, CO, NCO or NH (the last 2 optionally nubstituted by 1-6C alkyl), Z1 and Z = 0, S, COO, NH, CS, NH, NGO or NHCS, s and t = 0-3, B = phenyl or cyclohexyl ring, b = 0 or 1, K is a chetating residue. The compounds of the invention are useful as diagnostic agents, including contrast agents for X-ray and NMR imaging of pathological vascular changes e.g.

CX ray and NMR imaging of pathological vascular changes before these become standiopharmaceuticals. The invention allows the marking of possible early non-invasive diagnostic agents they have better pharmacokinetic properties and provide improved contrast. They have better pharmacokinetic properties and provide improved contrast. They have better pharmacokinetic properties and provide improved contrast. They have excellent in vitro and in vivo stability on significant release or exchange of bound radionucleotides). This sequence is a specific claimed example of a peptide used in the construction of the metalcomplex-conjugates of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New complexes of derivatised endothelin or related cpds. - with radioactive or paramagnetic metal ions, useful as diagnostic agents for imaging pathological changes in blood vessels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

                                                                                                                                                                                                                                                                                                                                                                                                                          The peptide inhibits binding of endothelin-1 (ET) to ETA receptors and/or to ETB receptors. It can be used for detecting, distinguishing and isolating ET receptor subtypes. The peptides also act as ET antagonists and can be used to treat endothelinmediated disorders such as hypertension, pulmonary hypertension, cardiovascular disease, bronchoconstriction, asthma, inflammatory diseases, ophthalmolgic shock, anaphylactic shock, haemorrhagic shock, gastroenteric disease, renal failure, endotoxin shock, menstrual disorders, obstretic conditions, erythropoietin-mediated vasoconstriction and wounds.

The peptide is highly conserved in all known HIV strains. Peptides containing the SLWDQ sequence elicit a very strong immune response (both humoral and cellular) in subjects infected by HIV-1, i.e. an autoimmune reaction. Also, oligopeptides containing SLWDQ can inhibit T cell activation, probably by competition with the CD4-CMH2 interaction. Antibodies directed against the peptide or against multimers of the peptide can be therapeutically used to suppress the immune response in cases of HIV-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide(s) inducing an auto immune response in HIV infected subjects - also the multimer, proteins contg. them and derived antibodies, for treating or preventing HIV infection and for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A comparison of the CENP-B centromere protein sequence with proteins from immunoinfective cluster viruses revealed widespread homologies. The importance of these homologies motifs is that they are epitopes for autoantibodies occurring in high titres in systemic rheumatic disorders. Sera from such patients could be used for treatment of immunoinfective cluster virus infections, e.g. HIV-1, immunoinfective adenoviruses, human lymphotropic retroviruses,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                CENP-B protein residues 191-195, homologous to SRV-1 protease motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Methods for treating immunoinfective cluster virus infections -
utilise antibodies or fragments characteristic of auto antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This peptide is one of 14 endothelin derivatives which are preferred for use in conjugates with novel bis-(N' (mercapto-ethyl-or -propyl) aminocarbonylmethyl) oxide, sulphide or selenide compounds. The chalcogen-containing compounds are ligands which are land that a technetium or rhenium radioisotope. The iligand-peptide conjugates are useful for non-invasive, in vivo imaging, e.g. of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bis-(N-(mercapto-ethyl- or -propyl) amino:carbonyl:methyl) oxide, sulphide or selenide and derivs. - are ligands for radioactive technetium or rhenium for diagnosis and therapy, e.g. for

New cyclic pentapeptides are disclosed which have a gamma-turn and a beta-turn and which are of formula Cyclo(-Al-A2-A3-A4-A5-) where the amino acids in positions 1-2-3 form a gamma-turn and the amino acids in positions 3-4-5-1 form a beta-turn in combination with the gamma-turn. Bither D-amino acid residues are chosen for Al, A3 and A5 and L-amino acids for A2 and A4; or L-amino acid residues are chosen for A1, A3 and A5 and D-residues for A2 and A5. The peptides are chosen for antagonists against the NKZ receptor or endothalin receptor. They can be used as antisathmatic, antiinflammatory or antiarthritic can be used as assay or affinity purification reagents for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New cyclic penta:peptide(s) having a gamma-turn and a beta-turn used as NK2 receptor antagonists for treating asthma,
/note= "D-Trp; and this amino acid is condensed onto the N-terminal to form a cyclic peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

beta-turn and which are of formula Cyclo(.A1-A2-A3-A4-A5.) where the amino acids in positions 1-2-3 form a gamma-turn and the amino acids in positions 3-4-5-1 form a beta-turn in combination with the gamma-turn. Either D-amino acid residues are chosen for A1, A3 and A5 and L-amino acids for A2 and A4; or L-amino acid residues are chosen for A1, A3 and A5 and antagonists against the NC2 receptor or endothelin receptor. They can be used as antiasthmatic, antiinflammatory or antiathritic agents or as assay or affinity purification reagents for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New cyclic pentapeptides are disclosed which have a gamma-turn and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New cyclic penta:peptide(s) having a gamma-turn and a beta-turn
used as NK2 receptor antagonists for treating asthma,
inflammation or arthritis
/note= "D-Glu; and this amino acid is part of a
cyclic structure formed by condensation
with the C-terminal amino acid"
                                                                                                                                             0

The chalcogen-containing compounds are ligands which are complexed with a technetium or rhenium radioisotope. The ligand-peptide conjugates are useful for non-invasive, in vivo imaging, e.g. of receptors or of

The sequences given in AAR73170-83 represent peptide ligands which are used with the radioactive peptide complex of the invention. The complexes may be used to image receptors, specifically of steroid hormones, receptor contg. issue and/or atherosclerotic plaque. These peptides allow the complex to be targetted to a specific tissue. These peptides are pref. derived from endothelin, and represent analogues, derivatives or antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "optionally has a carboxyl, amido, hydrophobic or macromolecular carrier gp. attached"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "optionally has an amino, acetyl, 9-fluorenylmethoxy-carbonyl, hydrophobic or macromolecular carrier gp. attached"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

DP-178 corresponds to amino acids 638 to 673 of the HTV-1 isolate LAI transmembrane protein 1991. It ectodomain, and complexes with DP-107 (corresponds to amino acids 558-595) which contains a leucine zipper motiff. The peptides complex activity. The peptide derivs. were identified by a computer assisted peptide sequence search. The peptides inhibit transmission to uninfected cells, and can also be used as type and/or subtype uninfected cells, and can also be used as type and/or subtype

The invention relates to the new use of known endothelin receptor antagonists for prophylaxis and/or therapy of hypofunction of organs (particularly the liver) which occurs following their surgery or transplant. The present sequence is a specific example of a suitable antagonist listed in the Claims.
                                                                                                                                                                                                                                                                                                                                                                                                       /label= OTHER

The present sequence is a specific example of a suitable antagonist listed in the Claims.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the new use of known endothelin receptor antagonists for prophylaxis and/or therapy of hypofunction of organs (particularly the liver) which occurs following their surgery or transplant. The present sequence is a specific example of a suitable antagonist listed in the Claims.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Endothelin receptor antagonist; organ hypofunction; liver; surgery; transplant; cyclic.

The invention relates to the new use of known endothelin receptor antagonists for prophylaxis and/or therapy of hypofunction of organs (particularly the liver) which occurs following their surgery or transplant. The present sequence is a specific example of a suitable antagonist listed in the Claims.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Endothelin receptor antagonist; organ hypofunction; liver; surgery;
transplant; cyclic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the new use of known endothelin receptor antagonists for prophylaxis and/or therapy of hypofunction of organs (particularly the liver) which occurs following their surgery or transplant. The present sequence is a specific example of a suitable antagonist listed in the Claims.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cyclic endothelin receptor peptide for treating organ hypofunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Endothelin receptor antagonist; organ hypofunction; liver; surgery;

                                                                                                                                                     The invention relates to the new use of known endothelin receptor antagonists for prophylaxis and/or therapy of hypofunction of organs (particularly the liver) which occurs following their surgery or transplant. The present sequence is a specific example of a suitable antagonist listed in the Claims.

conjugates with peptides, proteins, biomolecules and macromolecules, conjugates with peptides, proteins, biomolecules and macromolecules, their complexes with metal ions and their water-soluble salts; where their complexes with metal ions and their water-soluble salts; where including at least one Met, Arg, Lys or Asn but no Cys; R1 is H or a hydrocarbyl or acyl group, or a bond to a conjugate; and R2 is OH, hydrocarbyloxy or an optionally substituted amine group (forming an amide), or a bond to a conjugate. The peptides are useful when complexed to a metal (e.g. 99m-TC) for in-vivo diagnostic imaging and therapy of tumours, organs and fooi of inflammation. Conjugates of the peptides can be targetted to specific tissues. A particular application is imaging of atherosclerotic plaque. Metal is bound with good in-vivo stability; unbound material is rapidly cleared; and there is no allergic reaction. Since the peptides are free of Cys, they can be prepared simply and rapidly and can be presented in the form of a kit for radio-pharmaceutical production. Specific examples of the peptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sex-hormone, human; veterinary medicine; cancer; prostate; uterus; breast; pituitary; prostatomegaly; endometriosis; hysteromyoma; precocious puberty; amenorrhoea; premenstrual syndrome; cyclic; multilocular ovarian syndrome; comedo; pregnancy; contraception; ovulation; menstrual cycle; cestrus; meat quality; growth; spawning; fish; testosterone; superagonist; leuprorelin acetate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "N-pToluenesulphonylarginine, D-form residue"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pharmaceutical production. Specific examples of the peptides are given in AARB6424 - AARB6439.
The present sequence is a specific example of an endothelin peptide which can be used as a conjugate with the new peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Luteinising hormone releasing hormone receptor; LH-RH; antagonist;

                                                                                                                                                                                                                                     inteinising hormone releasing hormone (LHT.RH) receptor antagonist composition of the invention. Peptides such as this are used to prevent or treat sex-hormone dependent disorders in human or veterinary medicine, esp. cancers (of the prostate, uterus, breast or pituitary), prostatomegaly, endometriosis, hysteromyoma or precocious puberty, but also amenorrhoes, premental syndrome, multilocular ovarian syndrome, also to induce ovulation) and the menstrual cycle. They are also used or control oestrus in animals, to improve meat quality and control growth, and to promote spawning in fish. They may also inhibit the transient increase in testoseerone blood levels caused by admin. of superagonists such as leuprorelin acetate.
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                              This peptide represents a cyclic peptide which is included in the

that bind to endothelial leukocyte adhesion molecule (BLAM)-1. This that bind to endothelial leukocyte adhesion molecule (BLAM)-1. This molecule is a member of the selectin family of receptors and is involved in binding of leukocytes to the vascular endothelial wall prior to extravasation of the leukocyte, e.g. to a site of inflammation.

The peptides bind pref to B-selectin but may also bind L- or P-selectin, and can be used to treat conditions mediated by E-selectin, e.g. inflammatory conditions. The peptides have strong affinity for the selectin receptors and inhibit the binding of the sialyl Lewis (SLE-x) car of cell surface glycoproteins to B-selectin. The peptide are small, generally less than 2 kD, have an IC50 of up to 100 micromole against binding of HL60 cells to BLAM-1, have one or more peptide linkages replaced by CH2OC(O)NR, phosphonate, CH2SOZNR, CH3ONR, CON(R6), or NHCONH linkages where R = H or a lower alkyl and R6 = a lower alkyl. The peptides may also have substituted N- and C-termini e.g. cucinimido, N-benzyloxycarbonyl or N-lower alkyl cpds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                 New peptide(s) that bind to endothelial leukocyte adhesion molecule 1 - useful for treating inflammation and other E-selectin mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bifunctional, bis-nicotinamide, chelator, radioactive, technetium, rhenium, conjugate, endothelin, angiotensin, targetting agent, organ, in vivo imaging, receptor; tissue, atherosclerotic plaque; diagnosis, breast, prostatic; carcinoma; cytostatic agent;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Targetting conjugate for bis-nicotinamide bifunctional chelator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

```
This peptide is an endothelin antagonist which is the active component in a new cerebral oedema inhibitor, used to prevent swelling in head injury, cerebral tumour, blood vessel damage in apoplexy, hypertension, respiratory failure, carbon monoxide poisoning, hyponatraemia, acute kidney damage, hyperglycaemia, hypoglycaemia, adrenal function failure, collagen disease, inadequate buffering of blood, or poisoning by tin, lead or arsenic. The inhibitor prevents cerebral hernia, headache, nausea, dizziness, restlessness and loss of consciousness, especially sudden death from cerebral hernia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bifunctional sulphonamide; ligand; radioactive; technetium; rhenium; conjugate; endothelin; angiotensin; targetting agent; organ; in vivo imaging; receptor; tissue; atherosclerotic plaque; diagnosis; breast; prostatic; carcinoma; cytostatic agent;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New sulphide-sulphonamide bi:functional chelating agents - forming new, stable technetium or rhenium complexes and conjugates useful as radiodiagnostic and radio-therapeutic agents
                            technetium and rhenium, when conjugated to an endothelin or angiotensin derived targetting agent, e.g. the present peptide, can be used for the in vivo imaging of corgans, receptors and receptor containing tissues and/or atherosclerotic plaques, e.g. for the diagnosis of breast or prostatic carcinoma. They can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      XSNS-type bifunctional sulphide containing sulphonamide chelating agents and their technetium or rhenium complexes, can form covalently bonded conjugates with subserses selectively enriched in diseased tissue, e.g. the present peptide. The substance is an endothelin or angiotensin peptide, or a partial sequence, analogue, derivative or antagonist, or a chemotactic peptide. The conjugates are radiodiagnostic or radiotherapeutic agents, useful in the diagnosis of tumours, ischaemia or atherosclerotic
                                                                                                                                                                                                                                                                                                                                                                                                                                           Conjugating cyclic peptide for radio-therapeutic/diagnostic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conjugate; diseased tissue; endothelin; angiotensin; chemotactic; radiodiagnostic; radiotherapeutic; diagnosis; tumour; ischaemia; atherosclerosis; vascular disorder; ischemia; circular; cyclic.
               Novel bifunctional sulphonamide type ligands for radioactive
                                                                                                                                                                         Length 5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide binding to low density lipoprotein - useful in removing LDL from body fluids and as carrier peptide(s) for drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present low density lipoprotein (LDL) binding peptide can be used as an absorbent to remove LDL from body fluids, or as a LDL binding reagent. The peptide can be prepared easily and at low cost, and has excellent stability and preservability. It specifically binds LDL, and does not cause bradykinin production, white blood cell activation or blood agglutination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide binding to low density lipoprotein - useful in removing LDL from body fluids and as carrier peptide(s) for drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present low density lipoprotein (LDL) binding peptide can be used as an absorbent to remove LDL from body fluids, or as a LDL binding reagent. The peptide can be prepared easily and at low cost, and has excellent stability and preservability. It specifically binds LDL, and does not cause bradykinin production, white blood cell activation or blood agglutination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide binding to low density lipoprotein - useful in removing LDL from body fluids and as carrier peptide(s) for drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present low density lipoprotein (LDL) binding peptide can be used as an absorbent to remove LDL from body fluids, or as a LDL binding reagent. The peptide can be prepared easily and at low cost, and has excellent stability and preservability. It specifically binds LDL, and does not cause bradykinin production, white blood cell activation or blood agglutination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, diabetes mellius type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including poteins Tau and Big Tau, ubiquitin B, apolipoprotein E, microtubule associated protein 2 (MAP2), neurofilament-M, mutofilament-M, neurofilament-M, neurofilament-M, neurofilament-M, protein (GRAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma 2 (bcl-2) prote-oncogene, semaphorin III, HUPF-1, high mobility group protein-C (HMGP-C) and neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "D-Glu is condensed onto D-Trp at position 5 to form a cyclic peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     tyrosine kinase blocker; chemotherapy; antibody; conjugate; cyclic.
                                                                                                     Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations - used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also for treatment and prevention with specific ribozymes or wild-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   endothelin receptor; antagonist; atherosclerosis; radionuclide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        65.2%; Score 15; DB 19; Length 5; 100.0%; Pred. The invention relates to (A) the use of conjugates of the following formula as therapeutic agents: B-Wn; where E = a residue which can bind an endothelin receptor, and is derived from an endothelin partial sequence or an endothelin an endothelin partial sequence or an endothelin an endothelin partial sequence or an endothelin an endothelin derivative, an endothelin partial sequence or an endothelin antagonist; W = an active group which: (i) is a radionuclide or conflormed an endothelin antigony an antibody, an antibody fragment, a complex with a conflormed ragery an antibody, an antibody fragment, a peptide, a carbohydrate, an endicament, a thrombocyte aggregation inhibitor, an anti-inflammatory, a calcium antagonist, a lipid lowering agent or anti-inflammatory a calcium antagonist, a lipid lowering agent or anti-inflammatory a calcium antagonist, a lipid lowering agent or an enemotherapeutic agent, an antibody, an antibody fragment, a peptide, a carbohydrate, an oligonucleotide, a protein tyrosine kinase cof the above formula in which wis a matibody, an antibody fragment, a poptide, a carbohydrate, an oligonucleotide, a protein tyrosine kinase blocker, an anti-thrombotic agent, a growth factor inhibitor, an anti-thrombotic agent, a growth factor inhibitor, an anti-thrombotic agent, a lipid lowering agent or an anti-thrombotic agent, a lipid lowering agent or an anti-thrombotic agent, a lipid lowering agent or an anti-thrombotic agent of cardiovascular disorders such as configeration, subarachmotid haemorrhage, preeclampsia, renal disorders, etc. The conjugates become enriched in cells in which endothelin receptors are expressed. Even at low doses a therapeutically effective enrichment of the active agent at low doses a therapeutically effective enrichment of sarpuence represents a specifically claimed endothelin receptor binding expression in the body, reducing side effects. The prinding expecifically claimed endothelin receptor binding expecifically cannel endothelin receptor binding expecifically cannel endo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps
                                                                                                                                                                                                                                             Therapeutic use, e.g. in treatment of atherosclerosis, of endothelin conjugates - which comprise residue which can bind endothelin receptor, conjugated to groups such as radionuclides or protein tyrosine kinase blockers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cyclic peptide which mimics surface feature of endothelin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                               The invention relates to cyclic peptides that mimic the surface features of the endothelin peptides. The peptides shown in the invention are pentapeptides, hexapeptides and heptapeptides that contain an L-Trp, D-Trp residue or a derivative of D- or L-Trp, such as N-Me-Trp. The peptides modulate the activity of one or more members of the endothelin family of pepides. They are useful for relieving symptoms of and for treating endothelin mediated disorders and diseases. The present sequence represents a cyclic pentapeptide.

```
The invention relates to cyclic peptides that mimic the surface features of the endothelin peptides. The peptides shown in the invention are pentapeptides, hexapeptides and heptapeptides that contain an L-Trp, D-Trp residue or a derivative of D- or L-Trp, such as N-Me-Trp. The peptides modulate the activity of one or more members of the endothelin family of pepides. They are useful for relieving symptoms of and for treating endothelin mediated disorders and diseases. The present sequence represents a cyclic pentapeptide.
                                                                                                                                                                                                       "D-form residue, carboxy group of Trp is condensed onto the amino group of Aspl to form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Non-crosslinked protein particle; diagnostic; therapy; monodisperse; albumin; haemoglobin; nanometer; micrometer; clearance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New cyclic penta-peptides which are mimics of C-terminus of natural endothelin-1 - useful for relieving symptoms of and for treating endothelin mediated disorders and diseases
condensed onto the carboxy group of Trp5 form a cyclic peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

                                                                                                                                                                                                                                                                     This invention describes a novel aqueous suspension of monodisperse particles on non-crosslinked, non-denatured albumin (50-5000 nm) which is stable against dissolving upon dilution with an alcohol-free aqueous medium. The method involves (a) forming an aqueous solution containing albumin and hemoglobin and (b) treating the aqueous solution with an alcohol to cause the solution to become turbid. The particles are useful as agents for in vivo administration, either of their own administration or as a vehicle for other therapeutic or diagnostic agents. The method permits the formation of albumin and hemoglobin particles in the nanometer and micrometer size range, in a form closer to their natural form than the forms of the prior art. The particles therefore constitute a more closely controlled agent for in vivo administration, with greater ease of clearance from the body after their period of usefulness.

ANY30952-Y31135 represent peptides used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gene characterisation, recombinase, homology clamp, homology motif tag, HMT; genetic manipulation, genetic engineering, gene transcripion, GPCR, drug target, homologous recombination; target identification; TGF-beta; G-protein coupled receptor; transforming growth factor-beta.

The invention provides compositions and methods for the evaluation and characterisation of individual and sets of genes in disease states. The composition comprises at least one recombinase and at least two singlestranded targeting polynucleotides which are substantially complementary to each other and each having a consensus homology clamp for a gene family; i.e. a homology motif tag (HWT). The composition is useful in kit form which include the composition as libraries or pools of degenerate casDNA probes along with other reagents such as recombinase etc. The methods and compositions are used for inactivation of a gene family gene conformation inchlumen animal or plant). This is useful for generating decrease or alter the biological activity of one or more genes in a cell of or transgenic nonhuman animal or plant). This is useful for generating animal models of disease, or in the elucidation of gene function and activity. Alternatively, the biological activity of the wild-type gene activity. Alternatively, the biological activity altered to mimic disease states. This includes genetic amnipulation of non-coding gene sequences that affect the transcription of genes, including promoter, repressors, enhancers and transcriptional activity altered to mimic sequences that affect the transcriptional activity of more compositions are useful in functional genes, uncluding promoter, compositions are useful in functional genes, as well as in election of new drug targets HMTs used in homologous recombination wide variety of related genes, potentially resulting in a wide variety of composition of continuing those related to disease states. This may also be done on a cellular level to identify genes involved in cellular level to identify genes involved in cellular level to identify genes involved in collular level to identify genes involved in collular level to identify genes involved in collular level to identify and transforming growth factor-beta (TGF-beta) gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                     New compositions and methods for targeting sequence modifications in related family genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antigenic peptide, streptokinase, streptokinase-specific antibody, thrombolytic activity, thrombolytic therapy, glomerulonephritis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a monospecific antibody that binds specifically with an epitope defined by the amino acid sequence shown here. The peptide corresponds to a fragment of a trypsin-digested human fibrinogen and is designated fragment B(beta)123-127. The antibody can be used for detecting and measuring enzyme-mediated breakdown of fibrinogen and fibrin. The specific detection of cleavage products of fibrin and fibrinogen permits the accurate and precise determination of thrombotic activity in individuals. The products can be used to study thrombotic development and thrombolysis.
                                                                                                                                                 The present sequence represents an antigenic peptide of streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. P1 is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic fever.
                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New monospecific antibody to fibrin(ogen) - which can selectively bind matrix metalloproteinase-mediated cleavage fragments of fibrin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 formyl peptide receptor family; FPR; inflammatory response up-regulation; chemoattractant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a peptide fragment of T20/DP178. T20/DP178 is helical segment of the ectodomain of HIV-1 protein gp41. T20/DP178 is located in the carboxyl terminus of the gp41 ectodomain. gp41 plays a critical role in the fusion of HIV-1 and host cell membranes. T20/DP178 interacts with members of the formyl peptide receptor (FPR) family and thereby up-regulates an inflammatory response, and acts as a potent chemoattractant and activator of human peripheral blood phagocytes (but not T cells). The present peptide can be used to modulate an inflammatory response in a subject.

Sequence 9, Application US/09924703

Patent No. US20020137898A1

GENERAL INFORMATION:

APPLICANT: FERUSSIA, BICE

APPLICANT: CLARK, STEVENC.

APPLICANT: CARRY, STEVENC.

APPLICANT: CLARK, STEVENC.

APPLICANT: MONG, CORDON G.

APPLICANT: MONG, CACRON G.

TITLE OF INVENTION: ANTIBODIES TO NATURAL KILLER STIMULATORY FACTOR

FILE REFERENCE: 01142.0142.0100

CURRENT APPLICANTON NUMBER: US/09/924,703

CURRENT FILING DATE: 1999-06-04

PRIOR FILING DATE: 1999-06-04

PRIOR FILING DATE: 1999-06-04

PRIOR FILING DATE: 1995-03-13

PRIOR FILING DATE: 1996-03-18
